

BEAM: Biometric ID Platform / CLASSIFICATION: Luminary

Founded in early 2022 by biometrics industry veteran Frances Zelazny, Anonybit is pioneering a unique and unphishable approach to biometric digital identity. This Biometric ID Platform **Luminary** specializes in decentralized biometrics, offering a platform that breaks a given biometric template into shards that are distributed across multiple servers. Each shard is useless on its own, rendering the data essentially worthless in the event of an attack against any one server. Anonybit's fully orchestrated platform is algorithm agnostic, and the company invites vendors to adapt their tech to its platform.

Privacy and data protection are essential to the future of biometric digital identity, so Anonybit's eponymous decentralized biometric storage technology is a showstopping differentiator. But it is important to highlight the company's strength as an integrated biometric identity platform. Many vendors, particularly in the IDV space, aspire to build themselves into platforms by adding additional point solutions that add authentication to their stack. Anonybit, by contrast, is a platform by design, taking a full identity lifecycle approach, orchestrating transactions, enhancing user privacy, and, of course, protecting biometric data in patented Anonybits.
